NETFLIX DATA ANALYSIS

A Python-based Exploratory Data Analysis Project

Tools: Python • Pandas • Matplotlib • Seaborn

Project Presentation

1. Project Overview

- This project explores a Netflix titles dataset containing movies and TV shows.
- The goal is to understand the content library using data cleaning, summaries, and visualizations.
- The analysis is performed with Python in a Jupyter Notebook.
- The project demonstrates practical data analysis and visualization skills.

2. Project Objectives

- Understand the structure and key columns of the Netflix dataset.
- Inspect and handle missing values where appropriate.
- Explore the distribution of Movies and TV Shows.
- Study trends by release year, country, rating, and genre where data is available.
- Communicate findings through clear charts and visual summaries.

3. Tools & Technologies

Tool	Purpose
Python	Core programming language for analysis
Pandas	Loading, cleaning, and exploring tabular data
Matplotlib	Creating charts and plots
Seaborn	Statistical visualizations
Jupyter Notebook	Writing and running analysis step by step

4. Visualizations & Analysis

- Charts help reveal patterns that are difficult to see in raw rows of data.
- Useful views include content type counts, release-year distribution, ratings, and country/genre summaries.
- The exact conclusions should be taken from the charts and outputs in the project notebook.

Note: This presentation summarizes the project workflow; it does not claim exact numeric findings that have not been verified from the notebook.

5. Project Files & How to Run

• netflix_titles.csv — dataset used for analysis.

• netflix py.ipynb — Jupyter Notebook containing the Python analysis.

• README.md — project description and repository guide.

• To run: open the notebook in Jupyter Notebook or Google Colab, ensure the CSV path is correct, and run the cells in order.

Thank you!
